

# SUMMER SHOT GUITAR BUILDER

During this intensive six-day program, you will learn the fundamental skills of the guitar-making process by building your own custom instrument under the guidance of expert instructors. By the end of the program, you will not only know how it's done, but you'll take home a brand-new guitar (MI gig bag also provided).

In just one week, you'll learn how to:

- Cut your body from the wood blank using super-accurate CNC technology and shape the final details by hand
- Design and cut the headstock
- Finish and detail the body and neck
- Wire and install pick-ups and electronics
- Set up and fine-tune your guitar to pro specifications
- Install hardware

## S-Style

After you enroll, view the options below for body style, electronics and hardware and email program director John Carruthers ([johnc@mi.edu](mailto:johnc@mi.edu)), who will help you make your final selection. When you arrive, all of the components of your custom guitar will be waiting for you to cut, shape, assemble and finish using a combination of precision machine tools and hand-crafting techniques.

**Kluson Tuners**
